

Better financial management for faster business growth

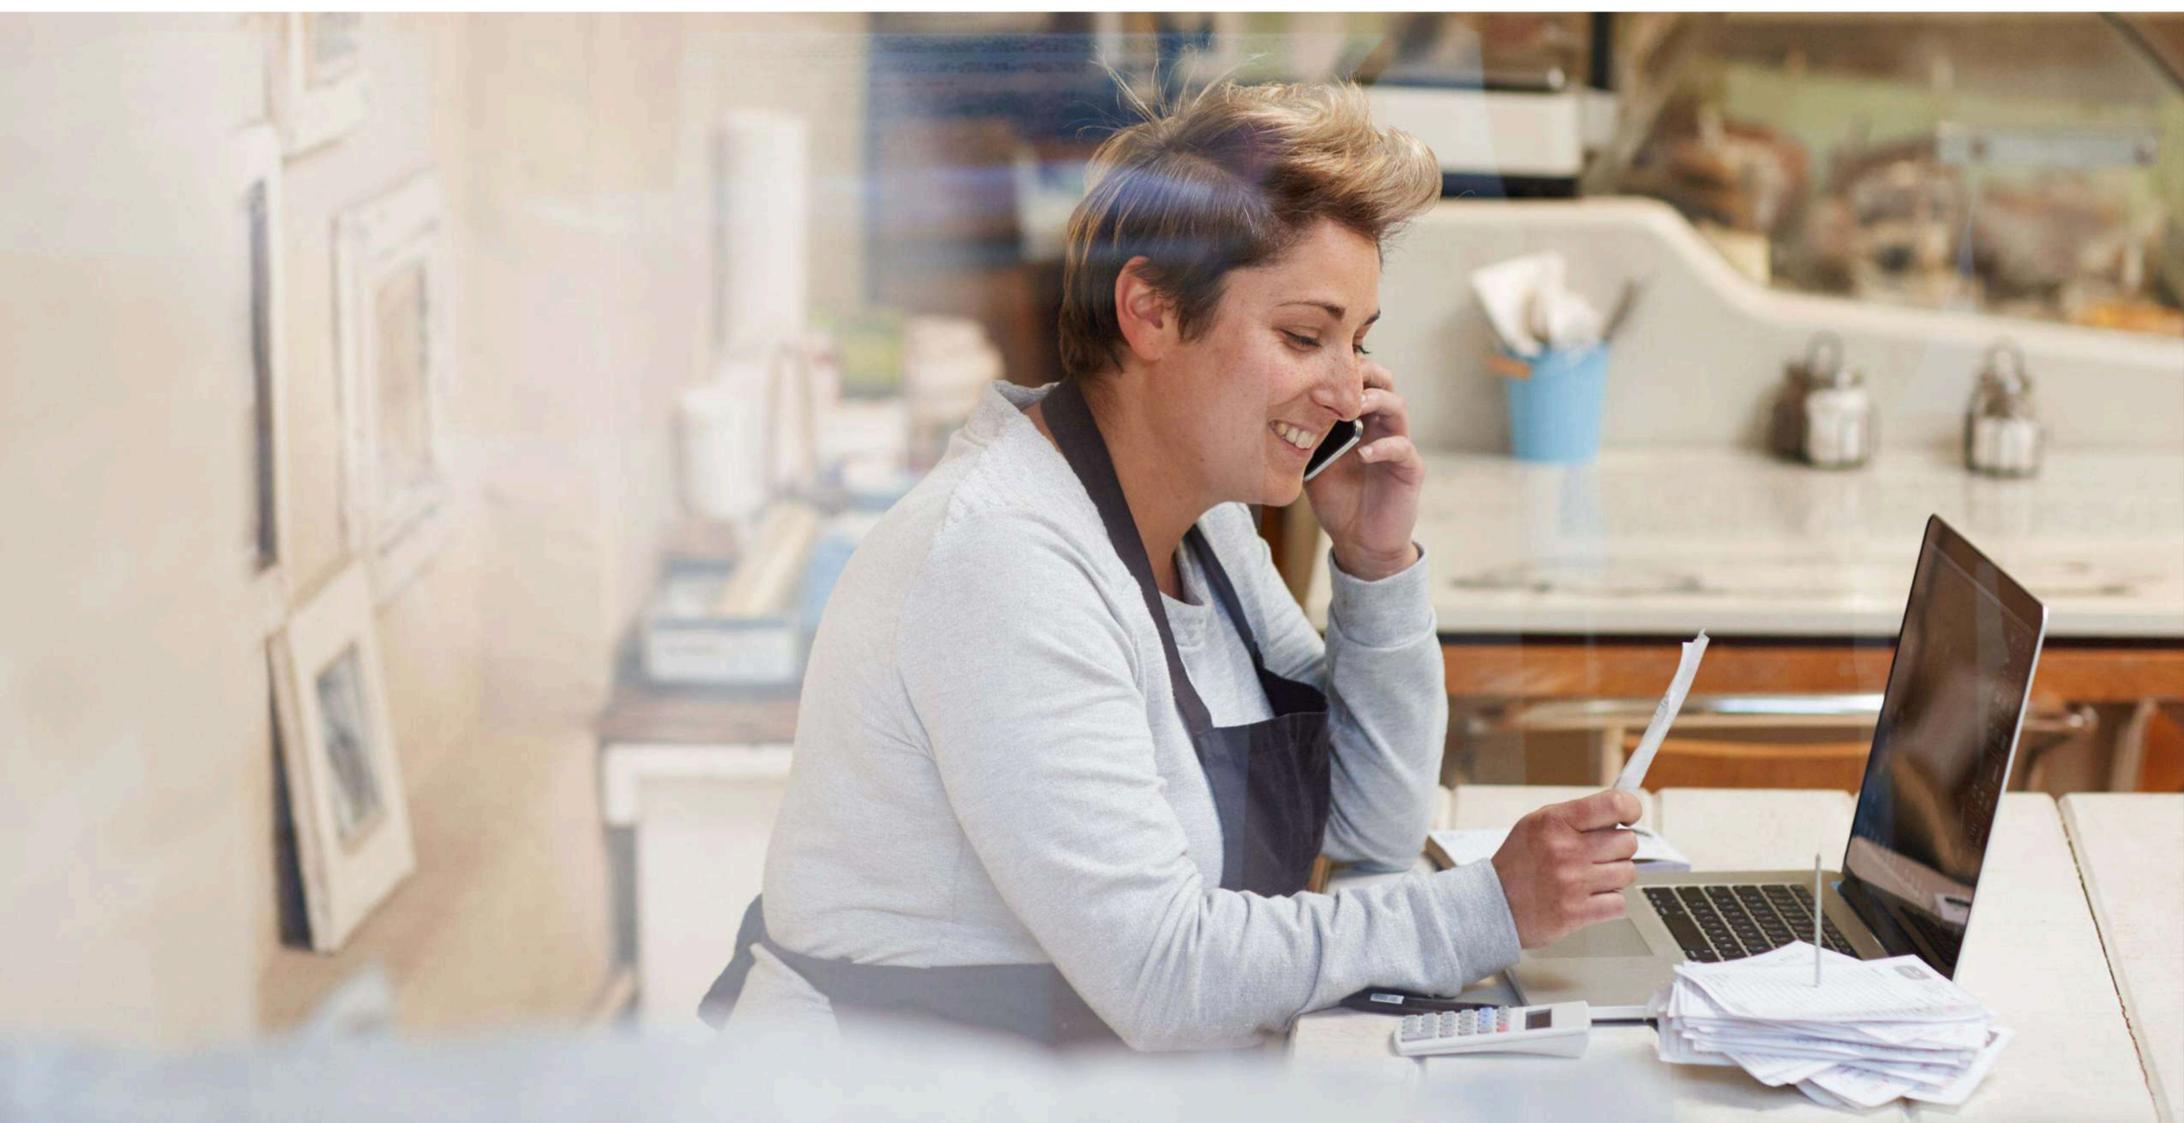

A six-point checklist for scalable, sustainable financial management

What does “digital transformation” mean to medium-sized businesses?

Big businesses love digital transformation. They know it improves efficiency, saves time and money, and increases employee productivity. Insights from more sophisticated, better connected corporate digital solutions can provide deeper insight into business operations, improve both corporate decision-making and, ultimately, customer satisfaction.

But as a medium-sized company, you have a leaner budget. And often, it needs to be thinly spread across many high-priority, but often competing, goals. Many SMBs on the path to growth prioritize customer service management, workflow automation or collaboration software in line with their business priorities. Yet, there is one frequently overlooked area of investment that impacts all of these: your financial management system.

Transforming your financial management software proactively to help your business scale sustainably is not what many people think of when they start plotting the exciting milestones of their growth plan, but it’s time well spent and an investment that could help, or hinder, every other stage of your next chapter.

What does digitally transforming your finances look like?

When your business was smaller, you probably just needed software for bookkeeping and taxes. But now, the lack of a more comprehensive financial situation limits you. Your business is growing. Whether you're diversifying or working to capture more of your existing market, you need a financial management solution that can scale. It must help you manage the new complexities that come with growth. It must also provide you with deeper insight into financial operations, enabling you to better understand cash flow, revenue streams, costs, and tax liabilities.

These needs are near universal. Other requirements vary by industry. Manufacturers and retailers, for example, need to make sure they have the right products available in the right amounts at the right place and time. They need to better forecast demand. Sales reps need to understand what stock is available for sale, and what has already been spoken for. Others need improved project management capabilities, greater real-time visibility into project profitability, better job costing, and remote time entry for employees working offsite.

Here are just **some of the capabilities that large-scale, mature enterprises expect from their financial management platforms—and which are crucial for fuelling successful, rapid growth** at any organization with 10 or more employees.

- **Fast, streamlined payroll** that is fully integrated with employee data for accurate payroll and payroll-tax filing, plus same-day direct deposits.
- **Real-time inventory visibility** to help decrease order fulfillment times and reduce inventory surplus.
- **Automated employee time tracking** to help reduce payroll processing time and increase billable time through more automated time tracking.
- **Online, outsourced bookkeeping.** Having a trusted bookkeeper taking the lead on everyday bookkeeping chores and running essential reports, leaves your leadership team more time to focus on your business.
- **Easier payment processing.** No more chasing down payments, cashing in cheques, or paying wire fees—customers can pay you directly by credit card or bank payment.
- **Reduce manual work and reduce the risk of errors by** automating everyday tasks.
- **Gain insight into business results** with powerful reporting.

Without these capabilities in place and accessible to your entire finance department, your company's ability to compete will be limited. Rather than turning to an enterprise resource planning (ERP) solution—which are expensive and complicated to run—medium-sized companies typically find more success by leveraging a flexible, user-friendly financial management solution that improves business efficiency, productivity and insight as the company scales up or down.

What is enterprise resource planning (ERP)?

“Enterprise resource planning” is a term used for software suites that integrate key back-office functions (including finance, human resources, customer relationship management, and IT) into a single system. ERPs are often sold as an all-in-one business solution. And in fact, integrating all of your back-office operations into a single module does sound ideal.

But implementing an ERP can be an expensive proposition. Although costs vary depending on number of employees and precise implementation, the average budget for an ERP is \$8,265 per user, which can add up quickly.¹ Since these systems can be complex to operate, they often demand a dedicated, experienced staff.

In addition, the pricing structure of ERPs typically require that businesses pay for all solution components. You’ll pay for supply chain management and business intelligence capabilities, regardless of whether you’ll ever use them.

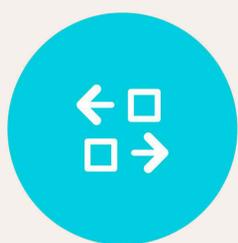

The 6-point checklist for a scalable financial management solution

Scalability

As a medium-sized business, you need a financial management solution that can grow with you. It must fulfill the needs you have right now, and enable you to obtain additional capabilities when necessary.

Consider this scenario. You're the owner of a manufacturing company that employs 10 people. Right now, you may have no reason to give your HR team one-click access to every employee's health plan, RRSP, or workers' comp benefits. But that capability may become necessary as you grow. You may need it to keep everyday requests for information from overwhelming HR. Consider investing in a system that can provide this capability when you need it.

Modularity

Financial services modules in a solution should accommodate the differing needs of different industries. Construction job costing doesn't do much for manufacturing or warehouse operations. Contractors aren't going to use bin-level inventory management features. Make sure your solution offers modules tailored to your business type.

☑ **Integration**

Invest in a financial management system that integrates with the apps your business already depends on. Construction companies, for example, often use CoConstruct and Buildertrend for project management, job costing, and tracking job-site activity. Manufacturers rely on Asset.Guru for asset management and Boxstorm for barcode scanning. The right financial management systems will allow for easy integration with apps, so your team can keep using the systems that work for them and have all data in one accessible place.

☑ **Automation**

Automating data entry, tax preparation and filing, and invoicing significantly reduces margins of error. It also improves productivity and efficiency. Not all processes can be automated equally however, so in addition to automation capabilities, your chosen solution should come with expert support to help you best digitize your manual tasks.

☑ **Insight**

Look for a financial management solution that provides you with deeper insight into business operations and performance. The right financial management solutions can automate reporting. Depending on your business and industry, these reports may cover profit and loss, balance sheets, income and expenses, cash flow, sales by customer segment, inventory stock, and inventory valuation.

☑ **Support**

No matter how user-friendly a financial management system is, there is no telling what might need further investigation or advice. Because your business never stops, you should look for a solution that can also provide you with the premium support your own customers expect from you.
